LIST OF CHINESE TURTLES, CROCODILIANS, AND SNAKES, WITH KEYS¹

By CLIFFORD H. POPE

The contents of this paper have been taken from the completed manuscript of a work by me on the reptiles of China, which is to appear soon as volume X of 'The Natural History of Central Asia,' a series of twelve volumes now in course of preparation and publication by the American Museum. The vast material collected in China and Mongolia by members of the Central Asiatic Expeditions, under the leadership of Roy Chapman Andrews, forms the basis of these volumes.

The object of this paper is to present a list, together with means of identification, of all the valid forms of turtles, crocodilians, and snakes known with certainty to inhabit China northward to a line connecting the head of the Liaotung Gulf with the northernmost point of Kansu, and westward as far as the western boundaries of Chinghai and Hsikang. Keys for identification of all listed forms are included. Many of these keys, especially the longer ones, are entirely new.

The numerous differences between the present list and the one published by Mell in 1931 (Lingnan Sci. Jour., VIII, pp. 199–219) are due largely to my more conservative attitude in regard to the recognition of subspecies. Also, I hold that a subspecies is a form that has been shown to intergrade with another form.

The following points, arranged in three groups for convenience of reference, must be remembered in using the list and keys.

- 1.—Only the Chinese distribution of each form is given. Those forms known to occur only within the limits of China as outlined above are marked with an asterisk. Although listed occasionally, Hongkong is not considered a part of China.
- 2.—A rather wide distribution within a province is indicated when no specific localities are given. If no specific record exists for a province, the name of the province is followed by the abbreviated phrase "no loc." in parentheses. Due to its peculiar shape, sections of Szechwan are not easily designated by the use of the points of the compass; therefore, in some cases, the mention of Szechwan alone does not imply a distribution over the entire province.
 - 3.—Only well-authenticated locality records are included.

¹Publications of the Asiatic Expeditions of The American Museum of Natural History. Contribution No. 127.

- 4.—The keys are specifically constructed for the identification of material from China as already delimited and should not be fully depended upon for specimens from adjacent regions.
- 5.—All available literature published previous to January 1, 1934, has been included as well as a few papers dated 1934.

TURTLES (key p. 14)

DERMOCHELIDAE

DERMOCHELYS Blainville

Dermochelys coriacea (Linnaeus).

Amoy.

CHELONIIDAE (key p. 15) ERETMOCHELYS Fitzinger

Eretmochelys imbricata (Linnaeus).

Hainan region.

CHELONIA Latreille

Chelonia mydas (Linnaeus).

Islands near Hongkong.

CARETTA Rafinesque

Caretta caretta olivacea (Eschscholtz).

Hwangpu; between Four Sisters and Two Brothers Islands, east of Chusan.

PLATYSTERNIDAE

PLATYSTERNON Gray

Platysternon megacephalum Gray.

Kwangtung and Kwangsi; north along coast to region of Foochow.

TESTUDINIDAE (key p. 15)

CYCLEMYS Bell (key p. 15)

*Cyclemys flavomarginata sinensis $Hs\ddot{u}$.

Chunshan in Tungting Lake.

Cyclemys mouhotii Gray.

Namfong on Hainan.

*Cyclemys trifasciata (Bell).

Southern Kwangtung; Shihwantashan in southwestern Kwangsi.

*Cyclemys yunnanensis Boulenger.

Yunnanfu and Tungchwan in Yunnan.

GEOEMYDA Gray

Geoemyda spengleri spengleri (Gmelin).

Kwangtung (no loc.); Kwangsi.

CLEMMYS Ritgen (key p. 16)

*Clemmys bealei (Grav).

Futsing Hsien and region of Foochow in Fukien.

Clemmys mutica (Cantor).

Kunshan in Kiangsu; Ningpo and Chusan in Chekiang; Ningkwo in Anhwei; Hainan.

*Clemmys nigricans (Gray).

Southern China, probably Kwangtung.

Clemmys quadriocellata Siebenrock.

Lofaoshan, Hsiaokeng and Hainan in Kwangtung; Lohsiang and Shihwantashan in Kwangsi.

GEOCLEMYS Gray (key p. 16)

*Geoclemys kwangtungensis Pope.

Hsiaokeng, Lofaoshan and Tinghushan in Kwangtung.

Geoclemys reevesii (Gray).

Widely distributed in China where it is frequently transported by human agencies.

OCADIA Gray

Ocadia sinensis (Grav).

Hainan and mountains east of Shiuchow in Kwangtung; other somewhat uncertain records for more northern localities.

PSEUDOCADIA Lindholm

*Pseudocadia anyangensis (Ping).

Ancient ruins of Anyang Hsien in Honan; apparently extinct.

TESTUDO Linnaeus

Testudo elongata Blyth.

Living specimen purchased from a village near Nanning in Kwangsi.

TRIONYCHIDAE (key p. 16)

PELOCHELYS Grav

Pelochelys bibroni (Owen).

Region of Nodoa on Hainan; Foochow; repeatedly observed for sale in Canton market.

AMYDA Oken (key p. 16)

Amyda sinensis (Wiegmann).

Widely distributed in China.

Amyda steindachneri (Siebenrock).

Kwangtung (no loc.); Kwangsi; probably Kweichow.

CROCODILIANS

ALLIGATORIDAE

ALLIGATOR Cuvier

*Alligator sinensis Fauvel.

Lower Yangtze Valley, chiefly in the region of Wuhu and Taihu.

SNAKES (key p. 16)

TYPHLOPIDAE

TYPHLOPS Oppel

Typhlops braminus (Daudin).

Kwangtung; northward from Kwangtung to Changning and Nanan, in southern Kiangsi, and Foochow and Yenping in Fukien.

BOIDAE (key p. 17)

PYTHON Daudin

Python molurus bivittatus Schlegel.

Yuankiang in southern Yunnan; Kwangtung; Yenping in Fukien.

ERYX Daudin

Eryx miliaris roborowskii Bedriaga.

Sachow in Kansu; Edsin gol and fifty-five miles northwest of Ningsia in Ningsia.

XENOPELTIDAE

XENOPELTIS Reinwardt

Xenopeltis unicolor Reinwardt.

Wuyung in Kwangtung.

COLUBRIDAE (key p. 17)

Colubrinae (key p. 18)

SIBYNOPHIS Fitzinger (key p. 20)

Sibynophis chinensis (Guenther).

Widely distributed in southern and central China; no record for Yunnan.

Sibynophis collaris (Gray).

Husa Valley in extreme western Yunnan.

*Sibynophis grahami (Boulenger).

Yunnanfu, between Yunnanfu and Kutsing, and Wutingchow in Yunnan.

NATRIX Laurenti (key p. 20)

*Natrix aequifasciata Barbour.

Lohsiang in eastern Kwangsi; Kwangtung; Futsing Hsien, Foochow and Yenping in Fukien.

Natrix annularis (Hallowell).

Northern Fukien; northern and eastern Kiangsi; southern Anhwei; southern Kiangsu; Chekiang.

Natrix bitaeniata Wall.

Extreme western Yunnan.

Natrix chrysarga (Schlegel).

Hainan.

*Natrix craspedogaster (Boulenger).

Eastern central China south of the Yangtze River; from Yachow southeastward to the Yunnan border south of Süchow in Szechwan. *Natrix johannis (Boulenger).

Wutingchow region and Yunnanfu in Yunnan; Luningving (28° 27'×101° 43') and Omei Hsien in Szechwan.

Natrix nuchalis (Boulenger).

Northern Yunnan; Chiulung Hsien in Hsikang; Muping region, Washan region, Mt. Omei and Süchow in Szechwan; Ichang in Hupeh. *Natrix octolineata (Boulenger).

Central and northern Yunnan; southern Szechwan.

*Natrix ornaticeps (Werner).

Hainan; Lohsiang in eastern Kwangsi.

Natrix percarinata (Boulenger).

Southern and central China, south of the Yangtze in the east; Szechwan.

Natrix piscator (Schneider).

Widely distributed in extreme southern China, extending its range northward in the east to Wenchow in Chekiang and Hokow in northeastern Kiangsi.

*Natrix popei Schmidt.

Lohsiang in eastern Kwangsi; Linping and Hainan in Kwangtung. Natrix sauteri (Boulenger).

Lohsiang in eastern Kwangsi; Linping in northern Kwangtung; southern Fukien: Chouchiakou (southeast of Süchow) in Szechwan. Natrix stolata (Linnaeus).

Widely distributed in extreme southern China, extending its range northward in the east to Tunglu and the Chusan Islands in Chekiang and Hokow in northeastern Kiangsi; extreme western Yunnan.

Natrix subminiata subminiata (Schlegel) (see key p. 22).

Hainan.

Natrix subminiata helleri Schmidt.

Yenping in Fukien; Kwangtung; Lohsiang in Kwangsi; Hwangtsaopa in southwestern Kweichow; northern and extreme western Yunnan.

Natrix tigrina lateralis (Berthold).

Widely distributed in central and northern China.

PSEUDOXENODON Boulenger (key p. 22)

*Pseudoxenodon bambusicola Vogt.

Hainan and northern Kwangtung; Lohsiang in eastern Kwangsi; Futsing Hsien and Yenping in Fukien.

*Pseudoxenodon dorsalis (Guenther).

Chekiang (no loc.).

*Pseudoxenodon fukienensis Pope.

Chungan Hsien in northwestern Fukien.

*Pseudoxenodon karlschmidti karlschmidti Pope (see key p. 23)

Chungan Hsien and Yenping in Fukien.

*Pseudoxenodon karlschmidti sinii Fan.

Yaoshan in eastern Kwangsi; Kwangtung.

Pseudoxenodon macrops macrops (Blyth) (see key p. 23).

Eastern Hsikang; western and probably southern Yunnan.

*Pseudoxenodon macrops sinensis Boulenger.

Southwestern Szechwan; Yunnan plateau.

*Pseudoxenodon striaticaudatus Pope.

Chungan Hsien in northwestern Fukien.

Helicops Wagler

*Helicops yunnanensis (Anderson).

Extreme western Yunnan.

MACROPISTHODON Boulenger

Macropisthodon rudis Boulenger.

Foochow and Chungan Hsien in northern Fukien; northern Yunnan; ascent from Yenyuan to Santashan in southwestern Szechwan.

OPISTHOTROPIS Guenther (key p. 23)

Opisthotropis andersonii (Boulenger).

Hongkong.

Opisthotropis balteata (Cope).

Hainan and Wyung (east of Canton) in Kwangtung; Lohsiang in eastern Kwangsi.

*Opisthotropis kuatunensis Pope.

Chungan Hsien in northwestern Fukien.

Opisthotropis lateralis Boulenger.

Yaoshan in eastern Kwangsi.

*Opisthotropis latouchii (Boulenger).

Extreme northern Kwangtung; from Futsing Hsien to Chungan Hsien in Fukien; Pingsiang in Kiangsi.

*Opisthotropis maxwelli Boulenger.

Southern Fukien.

RHABDOPS Boulenger

Rhabdops bicolor (Blyth).

Chanta Valley in extreme western Yunnan.

TRIRHINOPHOLIS Boulenger

*Trirhinopholis styani Boulenger.

Chungan Hsien in Fukien: Mokanshan in northern Chekiang: Wangwanshan in southeastern Anhwei; Kuling in northern Kiangsi; Mt. Omei in Szechwan.

ACHALINUS Peters (key p. 23)

Achalinus rufescens Boulenger.

Namkao (Hainan) and between Linping and Chungsun in Kwangtung: Lohsiang in eastern Kwangsi; Fukien (no loc.).

Achalinus spinalis Peters.

Eastern Chekiang; Chungan Hsien in Fukien; northern and eastern Kiangsi; Nanking in Kiangsu; Ichang in Hupeh; Chouchiakou, Süchow, Mt. Omei and Washan in Szechwan.

Lycodon Boie (key p. 24)

Lycodon aulicus aulicus (Linnaeus).

Amoy; Pangsi in extreme western Yunnan.

Lycodon fasciatus (Anderson).

Northern and extreme western Yunnan; Ningyuan in southwestern Szechwan.

Lycodon ruhstrati (Fischer).

Huangchiakou (southeast of Süchow) and Mt. Omei in Szechwan; the Lushan in Kiangsi: Chungan Hsien and Futsing Hsien in Fukien; Lungtou in northern Kwangtung.

Lycodon subcinctus Boie.

Hainan and Foochow.

Dinodon Duméril (key p. 24).

*Dinodon flavozonatum Pope.

Chungan Hsien in Fukien; between Linping and Chunghsin in northern Kwangtung.

Dinodon rufozonatum (Cantor).

Widely distributed in northern and central China.

ZAOCYS Cope (key p. 24)

*Zaocys dhumnades dhumnades (Cantor) (see key p. 24).

Plains and lower mountains of central China.

Zaocys dhumnades montanus Pope.

Higher mountains of central and southern China.

Zaocys nigromarginatus (Blyth).

Ningyuan and Lushuiho in southwestern Szechwan; Tengyueh, twenty miles north of Yunnanfu and Yunnanfu in Yunnan.

PTYAS Fitzinger (key p. 24)

Ptyas korros (Schlegel).

Tunglu and Taichow in Chekiang; Hokow and Kiukiang in Kiangsi; Fukien; Kwangtung; Yaoshan in Kwangsi; Hsikwangshan in Hunan; Yuankiang and Chanta and Husa Valleys in Yunnan.

Ptyas mucosus (Linnaeus).

Taichow and Wenchow in Chekiang; Ichang in Hupeh; Hokow in Kiangsi; Fukien; Kwangtung; Yaoshan in Kwangsi; Tengyueh in Yunnan; Batang in Hsikang.

COLUBER Linnaeus

Coluber spinalis (Peters).

Widely distributed in northern China.

ELAPHE Fitzinger (key p. 24)

*Elaphe bimaculata Schmidt.

From Hankow eastward to Hangchow and Chinkiang. **Elaphe carinata** (Guenther).

Widely distributed in central China.

Elaphe davidi (Sauvage).

Chihfeng in Jehol; the Tungling near Moukden.

Elaphe dione (Pallas).

Widely distributed over northern China; Shanghai.

Elaphe frenata (Gray).

Chungan Hsien and Yenping in Fukien; Chayuanshan and Lungtou in northern Kwangtung.

Elaphe mandarinus (Cantor).

Chekiang; Chungan Hsien in Fukien; Wanszushan in northern Kwangtung; Kweichow (no loc.); Szechwan.

Elaphe moellendorffi (Boettger).

Nanning in Kwangsi; Canton, Wuyung and Namkong (east of Canton) in Kwangtung.

*Elaphe perlacea Steineger.

Yachow Prefecture in Szechwan.

Elaphe porphyracea porphyracea (Cantor) (see key p. 26).

Opien Hsien in Szechwan; north central and extreme western Yunnan.

Elaphe porphyracea nigrofasciata (Cantor).

Hainan, Lofaoshan and Lungtou in Kwangtung; Lohsiang in eastern Kwangsi; Fukien; Ningpo region in Chekiang.

Elaphe prasina (Blyth).

Pupiao, Imen Hsien and Wutingchow in Yunnan.

Elaphe radiata (Schlegel).

Southern Fukien; regions east and west of Canton in Kwangtung; Lohsiang in eastern Kwangsi; Yuankiang in southern Yunnan.

Elpahe rufodorsata (Cantor).

Central China east of Hankow and north of northern Fukien; northeastern China.

Elaphe schrenckii anomala (Boulenger).

Chihfeng in Jehol; Hsinglungshan, Peiping and the Western Hills in Hopei: Hululi (sixty-five miles southwest of Taiyuan) in Shansi; Tsingtao in Shantung.

Elaphe taeniurus Cope.

Widely distributed through southern, central and northeastern China.

RHYNCHOPHIS Mocquard

Rhynchophis boulengeri Mocquard.

Yaoshan in eastern Kwangsi.

DENDROPHIS Fitzinger

Dendrophis boiga boiga (Lacépède).

Hainan; Lungling in western Yunnan.

EURYPHOLIS Hallowell (key p. 26)

Eurypholis doriae (Boulenger).

Hokow in southeastern Yunnan.

Eurypholis major (Guenther).

Central and southeastern China, south of the Yangtze River in the east.

Eurypholis multicinctus (Roux).

Lohsiang in eastern Kwangsi.

CORONELLA Laurenti

*Coronella bella Stanley.

Kuatun in northwestern Fukien.

HOLARCHUS Cope (key p. 26)

Holarchus chinensis (Guenther).

From Lohsiang in Kwangsi northeastward to Nanking and Kiangyin in Kiangsu; Yunnanfu.

Holarchus formosanus (Guenther).

Wenchow in Chekiang; Hokow and Nanchang in Kiangsi; Fukien; Kwangtung; Yaoshan in eastern Kwangsi.

Holarchus violaceus (Cantor).

Southeastern coastal region as far north as Spider Island, Foochow and Yenping in Fukien.

OLIGODON Boie (key p. 26)

Oligodon eberhardti Pellegrin.

Lohsiang in eastern Kwangsi.

*Oligodon ornatus musyi (Roux).

Chungan Hsien in northwestern Fukien.

CALAMARIA Boie (key p. 26)

Calamaria pavimentata pavimentata Duméril and Bibron.

Lungan and Muping in Szechwan; Lohsiang in eastern Kwangsi; Canton region.

Calamaria septentrionalis Boulenger.

Southeastern China north to the Yangtze.

Homalopsinae

ENHYDRIS Latreille (key p. 26)

Enhydris bennettii (Gray).

Hainan.

Enhydris chinensis (Gray).

Ichang in Hupeh; Nanking in Kiangsu; Wenchow in Chekiang; Hokow and Changning in Kiangsi; Fukien; Kwangtung. **Enhydris enhydris** (Schneider).

No definite Chinese locality known; Hongkong.

Enhydris plumbea (Boie).

Wenchow in Chekiang; Fukien; Kwangtung.

Boiginae (key p. 27)

CHRYSOPELEA Boie

Chrysopelea ornata (Shaw).

Fukien (no loc.).

TAPHROMETOPON Brandt

Taphrometopon lineolatum (Brandt).

Sachow in Kansu; Ningsia region and Alashan in Ningsia.

AHAETULLA Link

Ahaetulla prasina (Boie).

Hokow in southeastern Yunnan; Yaoshan in eastern Kwangsi; Lofaoshan in Kwangtung.

PSAMMODYNASTES Guenther

Psammodynastes pulverulentus (Boie).

Fukien; Kwangtung; Yaoshan in eastern Kwangsi; Wutingchow in Yunnan.

Boiga Fitzinger (key p. 27)

Boiga kraepelini Stejneger.

Yaoshan in eastern Kwangsi; Yuanshan in northeastern Kiangsi; Chungan Hsien and Futsing Hsien in Fukien; Süchow in Szechwan. **Boiga multomaculata** (Boie).

Lohsiang in eastern Kwangsi; Kwangtung; Changning in southern Kiangsi; Futsing Hsien in Fukien.

ELAPIDAE (key p. 27)

Bungarus Daudin (key p. 27)

Bungarus fasciatus (Schneider).

Fukien (no loc.); Kwangtung; Lohsiang in eastern Kwangsi; Kutung and Hokow (28° $15'\times117^\circ$ 41') in Yunnan.

Bungarus multicinctus multicinctus Blyth (see key p. 27).

Southeastern China; eastern central China north to the Yangtze River.

Bungarus multicinctus wanghaotingi Pope.

Yuankiang in southern Yunnan.

CALLIOPHIS Gray

Calliophis macclellandi (Reinhardt).

Lushan and Pingsiang in Kiangsi; Chungan Hsien in northwestern Fukien; Kwangtung; Lohsiang in eastern Kwangsi.

HEMIBUNGARUS Peters

*Hemibungarus kelloggi Pope.

Chungan Hsien, Yenping, and Futsing Hsien in Fukien; Lohsiang in Kwangsi.

NAJA Laurenti (key p. 27)

Naja hannah (Cantor).

Foochow region; Kwangtung; Lohsiang in eastern Kwangsi.

Naja naja atra Cantor.

Chekiang; Kiukiang, and Hokow in northern Kiangsi; Fukien; southwestern Hunan; Lohsiang in eastern Kwangsi; Kwangtung.

НУДВОРНИДАЕ (key p. 28)

THALASSOPHINA Smith

Thalassophina viperina (Schmidt).

Hainan and Swatow in Kwangtung.

HYDROPHIS Latreille (key p. 28)

Hydrophis caerulescens (Shaw).

Tsingtao in Shantung; Swatow in Kwangtung.

Hydrophis cyanocinctus Daudin.

Hoihow and Hainan Strait; Foochow; Yenting in Chekiang; Shanghai.

Hydrophis melanocephalus Gray .

Wenchow in Chekiang.

Hydrophis ornatus ornatus (Gray).

Tsingtao in Shantung.

LAPEMIS Gray

Lapemis hardwickii Gray.

Tsingtao in Shantung.

Pelamydrus Stejneger

Pelamydrus platurus (Linnaeus).

Hoihow and Swatow in Kwangtung.

MICROCEPHALOPHIS Lesson

Microcephalophis gracilis gracilis (Shaw).

Hainan region.

AMBLYCEPHALIDAE

Amblycephalus Kuhl (key p. 28)

*Amblycephalus boulengeri Angel.

Kweichow (no loc.); Wanhsien region in eastern Szechwan.

*Amblycephalus chinensis Barbour.

Szechwan.

*Amblycephalus kuangtungensis Vogt.

Chungan Hsien in northwestern Fukien; Lofaoshan and Lungtou in Kwangtung; Lohsiang in eastern Kwangsi.

Amblycephalus moellendorffi (Boettger).

Hainan and Lofaoshan in Kwangtung; Lohsiang in eastern Kwangsi.

*Amblycephalus niger Pope.

Yunnanfu.

*Amblycephalus stanleyi Boulenger.

Chungan Hsien in northwestern Fukien.

Amblycephalus tonkinensis Angel.

Hainan.

*Amblycephalus yunnanensis $\mathbf{Vogt}.$

Tali region in Yunnan.

VIPERIDAE (key p. 29)

AZEMIOPS Boulenger

Azemiops feae Boulenger.

Yenchinghsi (Opien Hsien) and Chouchiakou (southeast of Süchow) in Szechwan; Pingsiang in Kiangsi.

VIPERA Laurenti

Viperi russelii siamensis Smith.

Wuyung and Namkong (both east of Canton) in Kwangtung.

CROTALIDAE (key p. 29)

AGKISTRODON Beauvois (key p. 29)

Agkistrodon acutus (Guenther).

Ichang and Wusüeh in Hupeh; Shenchow in Hunan; Mokanshan in Chekiang; Chungan Hsien in Fukien; northern Kwangtung.

Agkistrodon halys (Pallas).

Widely distributed in northern and central China.

*Agkistrodon monticola Werner.

Mountains just north and slightly west of Likiang in Yunnan.

*Agkistrodon strauchi (Bedriaga).

Hsikang; Sungpan in northwestern Szechwan.

Trimeresurus Lacépède (key p. 29)

Trimeresurus albolabris Gray.

Fukien; Kwangtung; Yaoshan in eastern Kwangsi.

Trimeresurus jerdonii Guenther.

Northern Yunnan; Szechwan; Ichang in Hupeh.

Trimeresurus monticola Guenther.

Tali region and Husa in Yunnan; Szechwan; Chekiang (no loc.); Chungan Hsien and Shaowu in northwestern Fukien.

Trimeresurus mucrosquamatus (Cantor).

Fukien; northern Kwangtung; Yaoshan in eastern Kwangsi; Szechwan.

Trimeresurus stejnegeri stejnegeri Schmidt (see key p. 29).

Yaoshan in eastern Kwangsi; Hainan and northern Kwangtung; Fukien; Tunglu, Mokanshan and the Ningpo region in Chekiang; Taolin (near Changsha) in Hunan.

Trimeresurus stejnegeri yunnanensis Schmidt.

Yunnanfu, Luchuan, Tali, and Tengyueh in Yunnan.

KEYS FOR IDENTIFICATION

TESTUDINATA

- I.—Limbs clawless; carapace with seven prominent, longitudinal ridges; size gigantic; marine...............Dermochelidae.
- II.—Limbs with one or more claws; carapace without seven longitudinal ridges.
 - A.—Shell covered with horny shields.
 - 1.—Digits not distinct; limbs paddle-shaped with one or two claws; size large; marine......Chelonidae.
 - 2.—Limbs not paddle-shaped; digits distinct; four or five claws present; not marine.

 - b.—Inframarginals lacking, plastral shields in contact with marginals..................Testudinidae.
 - B.—Shell covered with soft skin......TRIONYCHIDAE.

CHELONIIDAE				
I.—Four pairs of costal shields, the first separated from nuchal by the anterior				
vertebral. A.—Two pairs of prefrontals; dorsal shields strongly imbricate in early life, becoming juxtaposed with age				
Testudinidae				
I.—Limbs more or less flattened; digits webbed; top of head covered anteriorly with undivided skin; costal plates not wedge-shaped with alternating broad and narrow ends.				
A.—Hexagonal neural plates short-sided behind.				
1.—Plastron hinged; plastron connected with carapace by a ligament. CYCLEMYS.				
2.—Plastron not hinged; plastron directly united with carapace. Geoemyda.				
B.—Hexagonal neural plates short-sided in front; plastron not hinged;				
plastron directly united with carapace.				
1.—Entoplastron intersected by gularohumeral suture.				
a.—Alveolar surface of upper jaw without a longitudinal, median				
ridge .				
(1)—Top of head covered posteriorly with smooth, undivided skin; alveolar surfaces of jaws narrow. CLEMMYS.				
(2)—Top of head covered posteriorly with small shields or granular skin; alveolar surfaces of jaws broad.				
B.—Alveolar surface of upper jaw with a longitudinal, median ridge; top of head covered posteriorly with undivided skin; sides of head with numerous, narrow, longitudinal, yellow stripes				
Cyclemys				
 I.—Carapace strongly tricarinate, flattened between the lateral keels, posterior margin serrated				
A.—Plastron rounded or feebly nicked posteriorly				
1.—Top of head largely light yellow; plastron black with narrow, yellow margins				

2.—Top of head dark olive margined with yellow; plastron dull yellow save for a large reddish blotch in each shieldyunnanensis.
CLEMMYS
I.—Plastron emarginate posteriorly; top of head with one or two pairs of ocelli situated posteriorly; shell with more or less widely distributed vermiculations, small spots or short streaks.
A.—Save for ocelli, top of head uniform olive or chocolate brown. quadriocellata.
B.—Save for ocelli, top of head grayish olive with black vermiculations. bealei.
II.—Plastron deeply notched posteriorly; top of head without ocelli; shell without vermiculations, small spots or short streaks.
A.—Chin and throat uniform light yellow
Geoclemys
I.—Carapace tricarinate reevesii. II.—Carapace unicarinate kwangtungensis.
TRIONYCHIDAE
I.—Orbit nearer to temporal than to nasal fossa; postorbital arch narrower than diameter of orbit; proboscis as long as diameter of orbit
Amyda
 I.—Dorsal disc bordered anteriorly by a row of large tubercles; a conspicuous patch of tubercles on either side of base of neck
SERPENTES
I.—No teeth in upper jaw; body covered above and below with nearly

I.—No teeth in upper jaw; body covered above and below with nearly uniform, cycloid scales; tail not laterally compressed.

TYPHLOPIDAE.

- II.—Teeth present in both jaws.
 - A.—Maxillary horizontal, not erectile; fangs, if present, short.

 1.—Mental groove present.
 - a.—Maxillary bearing several teeth which are never preceded by fangs.
 - (1)—Vestiges of hind limbs usually evident as a clawlike spur on either side of belly opposite vent; top of head cov-

ered by numerous, small, irregular scales			
parietalsColubridae.			
b.—Maxillary always bearing fangs which are never			
preceded by other teeth.			
(1)—Tail roundELAPIDAE.			
(2)—Tail laterally compressed.			
Hydrophiidae.			
2.—No mental groove; scales in 15 rows throughout.			
<u> </u>			
Amblycephalidae.			
B.—Maxillary short, vertically erectile, bearing only long,			
perforated fangs.			
1.—No loreal pitVIPERIDAE.			
2.—Loreal pit present Crotalidae.			
BOIDAE			
I.—Premaxillary toothed; labial pits present. Рутном. IJ.—Premaxillary toothless; no labial pits. Екух.			
Colubridae			
I.—Maxillary teeth not grooved. II.—Posterior maxillary teeth grooved. A.—Nostrils valvular and superior; aquatic. Homalopsinae. B.—Nostrils lateral; terrestrial or arboreal. Boiginae.			

Colubrinae

II.—Snott not produced into a pointed appendage covered with small scales. A.—Subcaudals entire; postcoculars absent. B.—Boardals divided; postcoculars present. 1.—Temporals are reen number of rows (except posteriorly in Plyas mucosus). 2.—Temporals present; internasals normally absent only in Oligodom eberhardti. 2.—Temporals present; internasals normally absent only in Oligodom eberhardti. 2.—Temporals present; internasals normally absent. 3.—Scales in an even number of rows (except posteriorly in Plyas mucosus). (1)—Two or more loreals present. (2)—Loreal single, sometimes absent. a ".—Mid-dorsal scale row enlarged. b'.—Mid-dorsal scale row on the elarged. a ".—Prefrontal entire. (a)—A single internasal. (b)—Two internasals. (a)—A single internasal. (a)—A single internasal. (b)—Two internasals. (b)—Anal divided; scales in 13-15 rows at mid-body. (b)—Anal entire. (c)—Anal divided; scales in 13-15 rows at mid-body. (b)—Anal entire. (c)—Maxillary teeth 37 or fewer in number, uniform in size; scales smooth, normally in 17 rows throughout. (a)—Maxillary teeth 37 or fewer in number. (b)—Maxillary teeth 37 or fewer in number. (a)—Maxillary teeth 37 or fewer in number. (b)—Maxillary teeth 37 or fewer in number. (c)—Coreal scales in 13-15 rows at mid-body. all corporation normally in 17 rows keeled. (a)—Indicating the propriate of the prop
--

than those just posterior to it. aa'.—Posterior group of maxillary teeth with three

teeth.....Dinodon.

bb'.—Posterior group of maxillary teeth with two teeth. Lycopon.

aa.—Maxillary with one or two toothless spaces, the teeth immediately anterior to the first or only space much larger

smooth, in 17 rows anteriorly, 15 before mid-dorsal stripe extending from frontal vent: a conspicuous, black-edged, yellow, anterior;

throughout length of maxillary eeth not longer than anterior; no blackstripe extending from body.....Coluber. mid-dorsal frontal throughout (bb')—Posterior edged,

9; scales (aa")—Maxillary teeth smooth, in 19 rows; ength of body.

229, subventrals caudals 51. CORONELLA.

(bb")—More than 9 maxillary

ELAPHE. teeth.

If this character presents difficulties, a study of the remainder of the key will show that a specimen may be carried to its proper genus by a process of elimination, without determining whether or not it has hypophyses developed posteriorly. In this connection, compare the scale row counts of Chinese Natrix, as indicated in the present key, with those of Edpaphe (p. 24). It should be evident that scale formulas alone will almost invariably suffice to place a snake in one of these two genera. Geographic probability often serves to carry one over a puzzling section of a key.

bb.—Maxillary without a toothless space preceded by teeth hemipenis deeply aa'.--Scales oblique anteriorly; larger than those following it.

aa"..-Last two maxillary teeth greatly enlarged; scales keeled, in 17-19 rows at mid-body, 15 before vent; anal divided forked.

PSEUDOXENODON bb".—Last two maxillary teeth not enlarged scales in 15 rows throughout; anal

bb'.—Scales not oblique anteriorly.

entire.....Trirentinopholis.

(aa)—A pair of prefrontals and interaa".—Hypophyses developed throughout vertebral column.1

more than 19 rows of scales (bb)—Either or both internasal and nasals always present; rarely present anteriorly or fewer than 17 posteriorly.. NATRIX.

bb".--Hypophyses present only on anterior than two scales....HELICOPS. vertebrae.

prefrontal divided into more

(aa)—Scales in 15 rows throughout; body green above and below or green with narrow, dorsal

cross-bands present pos-

teeth longer than -Scales in more than 15 rows teriorly EURYPHOLIS. (aa')—Posterior maxillary anteriorly.

SIBYNOPHIS

I.—Ten upper labials, only the very large eighth in contact with the single anterior
temporal
II.—Nine upper labials, eighth not very large; two anterior temporals, the lower larger
and in contact with the seventh and eighth upper labials, seldom entering
labial margin (rarely eight upper labials, the sixth and seventh in contact with
the lower anterior temporal).
A.—Subcaudals 83grahami.

NATRIX

- II.—Eye not preceded and followed by light, black-edged bars; not more than 100 subcaudals; fewer than 40 maxillary teeth.
 - A.—Conspicuous bands usually completely encircling the body, sometimes indistinct or wanting dorsally (and ventrally as well in *percarinata*).
 - 1.—Normally not more than one labial entering the eye, all rarely excluded from it by suboculars; maxillary teeth 23-28.
 - a.—Bands encircling body 16-21, those on tail 7-12, the former constricted on the flanks and usually double on the back and belly (not double in very young individuals); belly devoid of red; head long, its sides viewed from above nearly straight; labials rarely excluded from eye.

aequifasciata.

- b.—Bands encircling body very numerous, more than 30 on body and 14 on tail; belly red between the cross-bands; head moderately long, its sides viewed from above distinctly convex; all labials never excluded from eye...annularis.
- Two labials entering the eye; no red on belly; body bands, if distinct, at least 30 in number; maxillary teeth 29-32.

percarinata.

- B.—Body not encircled by bands.
 - 1.—Nuchal groove more or less developed.
 - a.—Nuchal groove always well developed; upper labials six or fewer: a single anterior temporal......nuchalis.
 - b.—Nuchal groove sometimes only poorly developed; upper labials eight or nine, rarely seven; two anterior temporals.

 subminiata.

2.—Nuchal groove absent (sometimes rudimentary in tigrina lateralis).

- b.—Neck and anterior part of body devoid of conspicuous, black cross-bands or checker spots separated by red interspaces; body nowhere predominantly green.
 - (1)—Dorsum distinctly lineate throughout, devoid of cross-bars and checkering.
 - a'.—Scales strongly keeled and distinctly notched at their posterior extremities....bitaeniata.
 - b'.-Scales not strongly keeled, not or scarcely notched at their posterior extremities.

octolineata.

- (2)—Pattern not distinctly lineate throughout.
 - a'.--A conspicuous lateral line along the belly formed by a black spot on the end of each ventral; belly immaculate between this line and its fellow; dorsum with no pattern or only a faint one; a whitish area on either side of the neck variable in size and shape. sometimes part of a light, longitudinal stripe and often inconspicuous (in chrysarga, lateral, ventral spots may be present but they are seldom evident anteriorly and the belly is often pigmented between them; the dorsum always has a double row of conspicuous, light spots; a light marking, usually in the form of a V with the apex directed posteriorly, is present on the neck). a".-Ventrals 165-175; subcaudals 85-91. johannis.

b".—Ventrals 157 or fewer.

(a)—Ventrals 138 or more; scales 19-17; five, rarely six lower labials in contact with anterior chin-shields.

craspedogaster.

(b)-Ventrals 140 or fewer.

(a')—Upper labials seven; scales in 17 rows throughout.

sauteri.

(b')—Upper labials eight; scales 19-17; four lower labials in contact with anterior chin-shields. . popei.

b'.—No lateral line along the belly formed by a black spot on the end of each ventral; a conspicuous dorsal pattern.

- b".—Internasals much narrowed anteriorly;
 back without whitish spots along
 either side, or, if present, such spots
 are boldly connected anteriorly by
 black cross-bands, and posteriorly coalesce to form a longitudinal
 stripe: scales keeled, but at least
 one outermost row smooth.
 - (a)—Anterior temporals normally single; three upper labials normally entering eye; all but outermost row of scales on either side keeled.

stolata

(b)—Anterior temporals normally two; two upper labials normally entering eye; at least two outermost rows of scales on either side smooth.

piscator.

Natrix subminiata

PSEUDOXENODON

I.—Light brownish-gray above, body and tail crossed by 15 to 24 conspicuous, black or black and gray bands, the first of which sends a narrow black stripe forward along the neck to the parietals where it joins its fellow of the opposite side.

bambusicola.

- II.—No conspicuous black cross-bands above; no black stripe extending along the neck to join its fellow on the parietals.
 - A.—A narrow, mid-dorsal, grayish stripe bordered with black present on the tail and persisting a variable distance anterior to the vent.

striaticaudatus or dorsalis.1

- B.—No black-bordered, grayish stripe present on tail.
 - 1.—Snout crossed immediately anterior to the eyes by a black band.

 fukienensis.

¹P. dorsalis is known from a single specimen. The status of the species is problematical and the characters distinguishing it from *striaticaudatus* too complex to be set forth in a key.

2.—Snout not crossed by a black band. a.—Maxillary teeth 19-22; pattern more or less infused with yellow; a black nuchal spot pointed anteriorly, forked posteriorly usually evident throughout lifemacrops. b.—Maxillary teeth 26 or 27; pattern devoid of yellow; a black, anteriorly pointed, posteriorly forked nuchal spot evident only in the young			
Pseudoxenodon karlschmidti			
I.—Ventrals 154 or fewer k. karlschmidti. II.—Ventrals 153 or more k. sinii.			
Pseudoxenodon macrops			
I.—Upper labials eight, rarely seven; ventrals rarely as few as $162m.$ m. macrops. II.—Upper labials seven, rarely eight; ventrals 162 or fewerm. sinensis.			
Орізтнотворіз			
I.—Upper labials thirteen to sixteen, irregular, many divided horizontally; scales in			
19 rows throughout			
 I.—Suture between internasals longer than that between prefrontals; 23-25 rows of scales at mid-body			

LYCODON I.—Preocular absent, prefrontal entering eye......subcinctus. II.—Preocular present, prefrontal excluded from eye. B.—Loreal not in contact with internasals. 1.—Loreal nearly always entering eye; preocular usually in contact with frontal; body and tail completely encircled throughout by alternate black and white bands......fasciatus. 2.—Loreal seldom entering eye; preocular never in contact with frontal; black bands of body nearly always interrupted on ventrals which are largely white (interruption of black bands more complete anteriorly than posteriorly and more evident in adults than in juveniles)......ruhstrati. DINODON I.—Blackish above with red cross-bands; loreal extended backward, usually entering eye; scales smooth or with a few mid-dorsal rows weakly keeled posteriorly; II.—Blackish above with yellow cross-bands; loreal seldom extended posteriorly, always excluded from eye; 6 to 9 scale rows more or less distinctly keeled ZAOCYS I.—Black, longitudinal lines more or less evident throughout length of body. II.—Black, longitudinal lines never present anteriorly, more or less evident posteriorly.....nigromarginatus. Zaocys dhumnades PTYAS I.—Scales in 21 or 19 rows on the neck, 17 at mid-body and 14 before the vent. mucosus. II.—Scales in 17 or 15 rows on the neck, 15 or 13 at mid-body and 11 before the vent. korros. ELAPHE I.—Dorsum uniform bright green with or without indistinct, lateral, oblique, black lines, or, if not green (juvenile frenata), loreal absent; complete scale formula 19-17-15. II.—Dorsum not bright green; loreal present (small, rarely absent, in mandarinus); scales in 17 or more rows just before vent.

A.—Scales in 19 or 21 rows at and anterior to mid-body, 17 just before vent.

1.—Scales smooth; ventrals fewer than 220.
a.—Scales in 19 rows at and anterior to mid-body; belly
immaculateporphyracea.
b.—Scales in 21 rows at and anterior to mid-body; belly con-
spicuously spotted with blackrufodorsata.
2.—Scales keeled; ventrals more than 220.
a.—Anal entire; eight or nine upper labialsradiata.
b.—Anal divided; seven upper labials perlacea.
B.—Scales in more than 21 rows either at or anterior to mid-body.
·
1.—Scales smooth; no subpreocular; dorsum gray, gaudily adorned
with numerous, rhomboidal saddles each consisting of a yellow
center broadly bordered with black which is in turn narrowly
margined with yellow
2.—Scales keeled, or, if smooth, a subpreocular present; dorsum with-
out conspicuous yellow and black rhomboidal saddles.
a.—One or two outer scale rows smooth at mid-body, the others
strongly keeled.
(1)—More than 200 ventralscarinata.
(2)—Fewer than 200 ventralsdavidi.
b.—More than two outer scale rows smooth at mid-body, keels,
when present, not strongly developed.
(1)—Tail with four black and four white longitudinal
stripes, one white one mid-dorsal, another mid-
ventraltaeniurus.
(2)—Tail without four black and four white stripes.
a'.—More than 250 ventrals moellendorff.
b'.—Fewer than 250 ventrals.
a".—Pattern complex in young, rapidly
fading with maturity: entirely or
almost entirely disappearing an-
teriorly and reduced to indistinct,
double, black blotches posteriorly;
postocular stripe solid black in
youngschrenckii anomala.
b".—Pattern complex, not changing notice-
ably with age, always uniform
throughout length of body; post-
ocular stripe olive gray with black
margins.
(a)—Lower labials eight to ten, rare-
ly eleven; both branches
of posterior head pattern ex-
tending caudad a short dis-
tance along neck as two par-
allel, black-edged stripes; a
double row of circular spots
along middle of back often
connected to form a dumb-

II.—Anal divided.

II.—Scales in 17, rarely 15, rows anteriorly.

labial entering eye.

B.—Scales in 21 rows at mid-body (rarely 23 in enhydris).

bell pattern; maxillary teeth 18-20.....bimaculata. (b)-Lower labials eleven to thirteen, very rarely ten; posterior head pattern ending abruptly on the occiput as two broad, divergent, blackedged spots; middle of back with numerous, narrow, black cross-bands never more than remotely suggesting a dumb-bell pattern: maxillary teeth 15-17. dione. Elaphe porphyracea I.—Longitudinal black lines absent or fragmentary anteriorly......p. porphyracea. II.—Longitudinal black lines complete or nearly complete throughout. p. nigrofasciata. EURYPHOLIS B.—Dorsum olive green crossed by numerous narrow, bichromatic bands posteriorly multicinctus. HOLARCHUS I.—Scales in 19 rows anteriorly formosanus. A.—Ventrum with a double row of distinct black spots; a conspicuous design B.—Ventrum without black spots; head and neck without design. . violaceus. OLIGODON I.—Internasals absent; scales in 13 rows at mid-body.....eberhardti. II.—Internasals normally present; scales in 15 rows at mid-body....ornatus musyi. CALAMARIA II.—Frontal as long as broad; tail blunt.....septentrionalis. ENHYDRIS I.—Scales in 19 rows at mid-body; two upper labials entering eye plumbea. II.—Scales in 21-25 rows at mid-body (very rarely 19 in enhydris); a single upper

 Dorsum grayish olive with two rows of irregular, black spots which may be more or less transversely or longitudinally connected.			
two light longitudinal linesenhydris.			
Boiginae			
 I.—One or more of the middle ungrooved maxillary teeth much enlarged. A.—Scales oblique, mid-dorsal row enlarged; pupil horizontal. Ahaetulla. B.—Scales not oblique, mid-dorsal row not enlarged. 1.—Anal entire; pupil vertically elliptic			
BOIGA			
 I.—Temporals not differentiated, their place occupied by numerous small scales; vertebral scale row not enlarged; anal divided			
ELAPIDAE			
I.—Mid-dorsal scale row enlarged; subcaudals undivided			
Bungarus			
I.—Pattern of black and yellow bands, all of which completely encircle the body; tail blunt			
Bungarus multicinctus			
I.—Light bands on body 31 or more			
Naja			
I.—An enlarged pair of contiguous occipital shields; scales in 15 rows at mid-body. hannah.			
II.—No enlarged contiguous occipital shields; scales in 21 (rarely 19) rows at mid-bodynaja atra.			

HYDROPHIIDAE

I.—Ventrals small but distinct throughout, not divided by a median suture. A.—Maxillary with 5 teeth in addition to fangs; ventrals broad anteriorly, narrow posteriorly
never divided by a median sutureLAPEMIS.
Нурворнія
 I.—Ten to 18 maxillary teeth in addition to fangs. A.—Ten to 13 maxillary teeth in addition to fangs. B.—Fourteen to 18 maxillary teeth in addition to fangs. Caerulescens. II.—Five to 8 maxillary teeth in addition to fangs. A.—Body slender anteriorly; normally a single, large anterior temporal. melanocephalus. B.—Body not slender anteriorly; two superimposed anterior temporals. cyanocinctus.
A sent troubtray tro
Amblycephalus
I.—Loreal broadly entering eye; preocular absent. A.—Ventrals 175-189; subcaudals 63-69; upper labials eight; scales smooth. boulengeri. B.—Ventrals 151-160; subcaudals 48-60; seven or eight upper labials; middorsal scales keeled
II.—Loreal excluded from or barely entering eye; preocular present. A.—Uniform dark grayish-brown above, a few black scales with white proximal tips scattered along the dorsum, these scales sometimes more or less regularly disposed to form narrow cross-bands; top of head devoid of pattern
bands which may (in <i>niger</i>) be predominant; head tawny brown with a black or blackish pattern (quite black in <i>niger</i>).
 Predominantly black above; head black, without pattern; ventrals 165; subcaudals 64
b.—Loreal excluded from eye (or occasionally entering it in chinensis); ventrals 175-194; scales smooth (sometimes weakly keeled in chinensis). (1)—Seven to 9 maxillary teethtonkinensis.

(2)—Four to 6 maxillary teeth.
a'.—Ventrals 175-180; subcaudals 60-74.
b'.—Ventrals 180-194; subcaudals 72-93. kuangtungensis.
Viperidae
I.—Head covered above with a few large, paired shields; scales of body smooth, in 17 rows
CROTALIDAE
I.—Head covered above with a few large, paired shields
Agkistrodon
 I.—Internasals and rostral produced to form a short, upturned appendageacutus. II.—Internasals and rostral normal. A.—Scales in 21 or more rows at mid-body. 1.—Internasals broader than long, often bandlike; a yellowish stripe beginning on the uppermost postocular and extending rearward
nearly always present
B.—Scales in 19 rows at mid-body; no yellowish stripe extending rearward from uppermost postocular
Trimeresurus
 I.—First upper labial partly (rarely not) separated from nasal by a suture; green (rarely with indistinct blackish cross-bands) above, upper lip and belly yellowish or greenish
along either side of the belly
Trimeresurus stejnegeri
1.—Scales in 21 rows at mid-bodys. stejnegeri II.—Scales in 19, rarely 21, rows at mid-bodys. yunnanensis
